Lean Vision card – Annual budget intake

This Vision Card outlines the desired business, customer and delivery outcome for your new project idea. This is a cut down version of the Vision card for annual planning purposes. The following questions will guide technical teams in providing ball-park T Shirt sizing for the proposal. If unsure, provide your best first draft — your Business Engagement Mobilisation Partner will help you refine this after submission.

Name	giffgaff: Replacing legacy OCS with Ericsson Charging Evolved AWS Public Cloud)	
Where did this idea originate? *MVNO*	**Strategic goal** *MVNO*	**Change type** *Regulatory/Mandatory*

1 Business outcome

What measurable change of a key business metric are you aiming to achieve with this proposal? E.g. Reduce basket abandonment in digital for consumer PAYM by 20% by Q4 2026 to achieve sales revenue increase of +15% in 2027.

Primary Outcome *(1 sentence, SMART)*	Secure support from VMO2 to replace the legacy Dublin-based OCS with a cloud-native Ericsson Charging Evolved platform in AWS (UK), including required network leased lines (if applicable), integrations and testing, to eliminate operational and vendor support risk by October 2028 and align with the strategic charging architecture, with giffgaff responsible for delivering and implementing the giffgaff-owned OCS solution and VMO2 responsible for delivering the network connectivity.	
Metric value today *(if known)*	*N/A*	
Value type ***Risk/compliance***	**Rough value size** Choose an item.	**By when** *Over X years*

2 Customer / User Problem

Who is impacted? *(e.g. customer type, colleague, segment etc)*	giffgaff members
What is their problem today? *(2-3 lines max)*	N/A
Why it matters *(1 line)*	For our members, an unsupported charging platform means facing a high risk of sudden, prolonged mobile service blackouts, incorrect billing, and the inability to buy or renew plans without any vendor fallback to fix the system.
What proof do you have?	N/A
Desired Future outcome	N/A

3 Delivery Outcomes

3.1 Key Capabilities Required

- *Describe what must exist – not how in 3-5 bullets.*
- **MVP = These requirements must be delivered by the project to achieve the minimum viable customer or commercial outcome*

#	Capability	MVP*
1	VMO2 provide integration support primarily network integration for the replacement of the giffgaff legacy Dublin-based OCS data centers with a cloud-native Ericsson Charging Evolved platform deployed directly within a multi-zone AWS architecture in the UK region (EU-WEST-2). giffgaff will continue to retain the full ownership and accountability for the delivery and implementation of its OCS solution. The target deployment will support 4.5 million active accounts and fully decommission the legacy on-premises end-to-end architecture by the October 2028 deadline, with the core charging engine distributed across a multi-zone AWS UK setup using two to three platform instances to provide resilient, automated failover.	Y
2	The Ericsson Charging Evolved solution will consist of both test and production nodes. VMO2 to provide connectivity from the network to the new OCS locations in AWS (if not already in place – if possible we would look to use zones/regions where VMO2 already have a presence). VMO2 to provide support to giffgaff throughout the testing phases (SIT & Network integration & Performance Testing) resulting from this change.	Y
3	giffgaff, with support from Ericsson, will be responsible for the migration from the legacy to the new solution, though some support may be required from VMO2 during this phase.	Y
Reporting / Analytics Requirements		
1		*Y*

3.2 Operational Impacts

Channel	Core domains / functions
☐ Digital / App ☐ Retail ☐ Care / contact centre ☐ Messaging ☐ Indirect	☐ Sales / shop / basket ☐ Order & fulfilment ☐ In-life service / management ☐ Billing / payment / finance / insurance ☐ Fraud management ☐ Customer data / Identity ☐ Network connectivity ☐ Mobile Devices / CPE / STB ☐ Wholesale partners ☒ MVNO

3.3 Complexity drivers

Please mark any that apply as these will improve the accuracy of your estimate – and avoid an under or over estimation of cost and time to deliver.

☐ Data or customer migration is required between suppliers or systems ☐ Decommissioning of legacy systems or suppliers ☐ New suppliers or systems introduced ☒ High transaction volumes >100k per month ☒ Realtime/sub-second response required ☒ Regulatory/compliance critical ☒ Security/fraud sensitive ☐ Customer critical journey (e.g. sales, faults, billing, payments)
Further information:

3.4 Timing

Target live date or window	Drop dead date of October 2028
Why this date matters	The current OCS is nearing the end of vendor support, leaving any future issues or required changes exposed to significant operational, regulatory and financial risk with no guarantee of resolution. Remaining on this platform increases the likelihood of service instability, higher maintenance costs, and challenges in meeting compliance and scaling needs. Transitioning from the current OCS to the AWS Public Cloud is essential to ensure long-term platform sustainability, regulatory alignment, and architectural consistency. This move also ensures compliance with required technology and assurance standards (TSA v2).

3.5 Constraints and Dependencies (Max 3)

Key constraints	OCS end-of-vendor-support
Known dependencies *(optional, if known)*	• The migration of the OCS platform to AWS Public Cloud must complete by October 2028 • Dependency on VMO2 teams for delivery

4 Ownership / Budget

Proposer	Colin Woods
Sponsor *(if known)*	Steve McDonald
Budget planning reference *(if known)*
